

## GENERAL DESCRIPTION

This document describes the specification for the IDTF1950 Digital Step Attenuator. The F1950 is part of a family of *Glitch-Free™* DSAs optimized for the demanding requirements of communications Infrastructure. These devices are offered in a compact 4x4 QFN package with 50 Ω impedances for ease of integration into the radio system.

## COMPETITIVE ADVANTAGE

Digital step attenuators are used in Receivers and Transmitters to provide gain control. The IDTF1950 is a 7-bit step attenuator optimized for these demanding applications. The silicon design has very low insertion loss and low distortion (+65 dBm IP<sub>3</sub>.) The device has pinpoint accuracy and settles to final attenuation value within 400 nsec. Most importantly, the F1950 includes IDT's *Glitch-Free™* technology which results in less than 0.6 dB of overshoot ringing during MSB transitions. This is in stark contrast to competing DSAs that *glitch as much as 10 dB* during MSB transitions (see p.10)

- ✓ Lowest insertion loss for best SNR
- ✓ Glitch-Free™ when transitioning – won't damage PA or ADC
- ✓ Extremely accurate with low distortion

## APPLICATIONS

- Base Station 2G, 3G, 4G, TDD radiocards
- Repeaters and E911 systems
- Digital Pre-Distortion
- Point to Point Infrastructure
- Public Safety Infrastructure
- WIMAX Receivers and Transmitters
- Military Systems, JTRS radios
- RFID handheld and portable readers
- Cable Infrastructure

## PART# MATRIX

Part#	Freq range	Resolution / Range	Control	IL	Pinout
F1950	150 - 4000	0.25 / 31.75	Parallel & Serial	-1.3	PE
F1951	100 - 4000	0.50 / 31.5	Serial Only	-1.2	HITT
F1952	100 - 4000	0.50 / 15.5	Serial Only	-0.9	HITT

## FEATURES

- *Glitch-Free™*, < 0.6 dB transient overshoot
- Spurious Free Design
- 3V to 5V supply
- Attenuation Error < 0.3 dB @ 2 GHz
- Low Insertion Loss < 1.3 dB @ 2 GHz
- Excellent Linearity +65 dBm IP<sub>3</sub>
- Fast settling time, < 400 nsec
- Class 2 JEDEC ESD (> 2kV HBM)
- Serial & Parallel Interface 31.75 dB Range
- 4x4 mm Thin QFN 24 pin package

## DEVICE BLOCK DIAGRAM

## ORDERING INFORMATION

**ABSOLUTE MAXIMUM RATINGS**

$V_{DD}$ to GND	-0.3V to +5.25V
D[6:0], DATA, CLK, LE, $V_{MODE}$	-0.3V to 3.6V
RF Input Power (RF1, RF2) calibration and testing	+29 dBm
RF Input Power (RF1, RF2) continuous RF operation	+23 dBm
$\theta_{JA}$ (Junction – Ambient)	+50°C/W
$\theta_{JC}$ (Junction – Case) The Case is defined as the exposed paddle	+3°C/W
Operating Temperature Range (Case Temperature)	$T_C = -40^{\circ}\text{C}$ to $+100^{\circ}\text{C}$
Maximum Junction Temperature	140°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature (soldering, 10s) .	+260°C

**IDTF1950 SPECIFICATION (31.75 dB Range)**

 Specifications apply at  $V_{DD} = +3.3V$ ,  $f_{RF} = 2000MHz$ , and  $T_C = +25^{\circ}C$ , EVkit losses are de-embedded (see p. 17) for spec purposes

Parameter	Comment	Sym.	min	typical	max	units
Logic Input High	CLK, LE, DATA, D[6:0], $V_{MODE}$	$V_{IH}$	<b>2.3</b>		3.6	V
Logic Input Low	CLK, LE, DATA, D[6:0], $V_{MODE}$	$V_{IL}$			<b>0.7</b>	V

LE delay from final serial clock rising edge	SPI 3 wire bus	<b>C</b>	<b>10</b>			ns

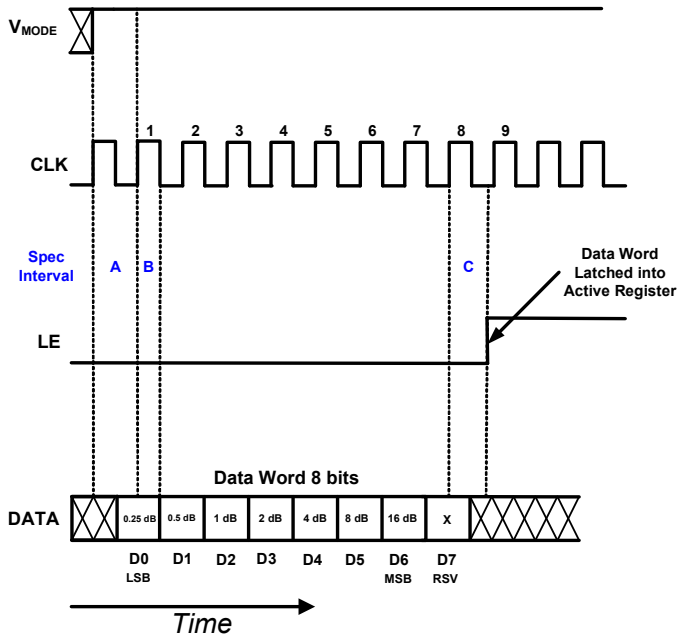

**SPECIFICATION NOTES:**

- 1 – Items in min/max columns in **bold italics** are Guaranteed by Test
- 2 – All other Items in min/max columns are Guaranteed by Design Characterization

**SERIAL CONTROL MODE**

Serial mode is selected by floating  $V_{MODE}$  (pin3) or pulling it to a voltage  $> V_{IH}$ . In serial mode data is clocked in LSB first. Note the timing diagram below.

**Note** – The IDTF1950 includes a CLK inhibit feature designed to minimize sensitivity to CLK bus noise when the device is not being programmed. When Latch enable is high ( $> V_{IH}$ ), the CLK input is disabled and DATA will not be clocked into the shift register. It is recommended that LE be pulled high ( $> V_{IH}$ ) when the device is not being programmed.

**SERIAL REGISTER TIMING DIAGRAM:** (Note the Timing Spec Intervals in **Blue**)

**SERIAL MODE DEFAULT CONDITION:**

When the device is powered up it will default to the **Maximum Attenuation** setting as described below:

**Note that for the F1950 in all cases (High or 1) = Attenuation Stepped IN. (0 or Low) = Attenuation Stepped OUT.**

**Default Register Settings**

0	1	1	1	1	1	1	1
D7 RSV	D6 MSB	D5	D4	D3	D2	D1	D0 LSB

**SERIAL MODE TIMING TABLE:**

Interval Symbol	Description	Min Spec	Max Spec	Units
A	Parallel to Serial Setup Time	100		nsec
B	Serial Data Hold Time	10		nsec
C	LE delay from final serial clock rising edge	10		nsec

**PARALLEL CONTROL MODE**

The user has the option of running in one of two parallel modes: *Direct Parallel Mode* or *Latched Parallel Mode*.

**DIRECT PARALLEL MODE:**

Direct Parallel Mode is selected when  $V_{MODE}$  (pin 3) is  $< V_{IL}$  and LE (pin 16) is  $> V_{IH}$ . In this mode the device will immediately react to any voltage changes to the parallel control pins [pins 19, 20, 21, 22, 23, 24, 1]. Use direct parallel mode for the fastest settling time.

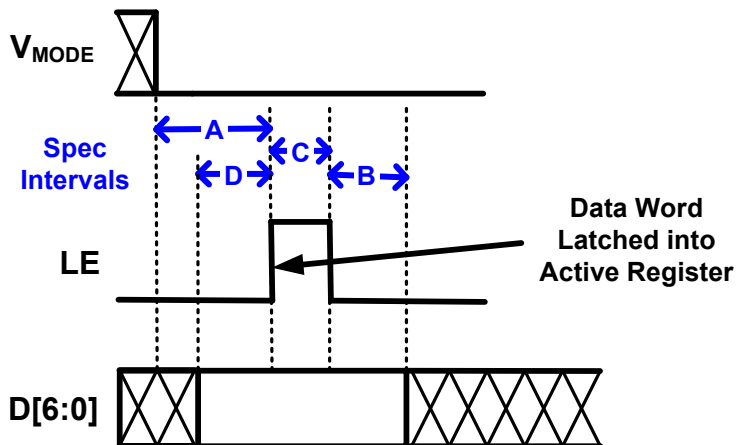

**LATCHED PARALLEL MODE:**

Latched Parallel Mode is selected when  $V_{MODE}$  (pin 3) is  $< V_{IL}$  and LE (pin 16) is toggled from  $< V_{IL}$  to  $> V_{IH}$ .

To utilize Latched Parallel Mode:

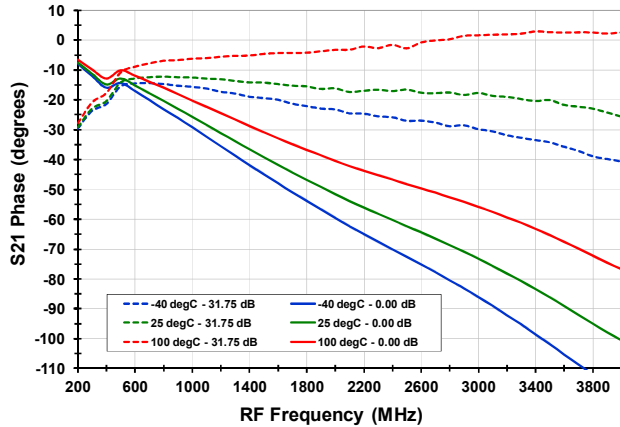

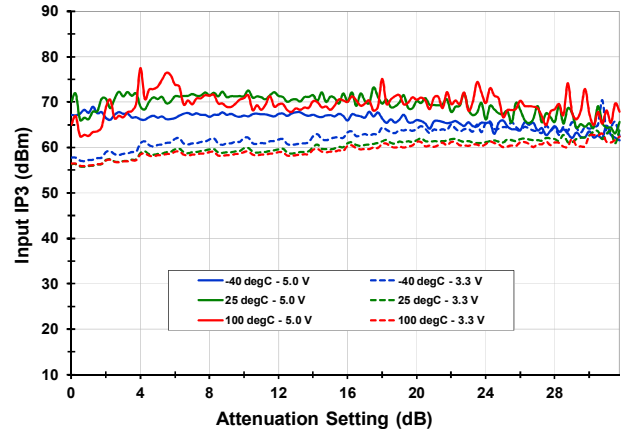

- Set  $LE < V_{IL}$
- Adjust pins [19, 20, 21, 22, 23, 24, 1] to the desired attenuation setting. (Note the device will not react to these pins while  $LE < V_{IL}$ .)
- Pull  $LE > V_{IH}$ . The device will then transition to the attenuation settings reflected by these pins.

Latched Parallel Mode implies a default state for when the device is powered up with  $V_{MODE} < V_{IL}$  and  $LE < V_{IL}$ . In this case the default setting is MAXIMUM Attenuation.

**LATCHED PARALLEL MODE TIMING DIAGRAM:** (Note the Timing Spec Intervals in **Blue**)

**LATCHED PARALLEL MODE TIMING TABLE:**

Interval Symbol	Description	Min Spec	Max Spec	Units
A	Serial to Parallel Mode Setup Time	100		nsec
B	Parallel Data Hold Time	10		nsec
C	LE minimum pulse width	10		nsec
D	Parallel Data Setup Time	10		nsec

**Transient [ 15.75 to 16.00 (MSB+) 3.3V F1950 ]**

**Transient [ 16.00 to 15.75 (MSB-) 5.0V F1950 ]**

The graphs above show the transient overshoot and settling time performance for both the MSB+ and MSB- cases for the F1950. The device settles very quickly ( $\sim 400$ ) nsec with benign ( $\sim 0.5$ ) dB overshoot.

The graphs below show the transient overshoot and settling time performance for a popular competing DSA. *Note the overshoot/undershoot excursion of almost 10 dB and the very long settling time. For the MSB- case, the settling time is off the scale,  $\sim 3$  usec.*

**Transient [ 15.75 to 16.00 (MSB+) Standard DSA ]**

**Transient [ 16.00 to 15.75 (MSB-) Standard DSA ]**

**PIN DIAGRAM (F1950)**

*\* Device is RF Bi-Directional*

**PACKAGE DRAWING (4X4 24 PIN)**

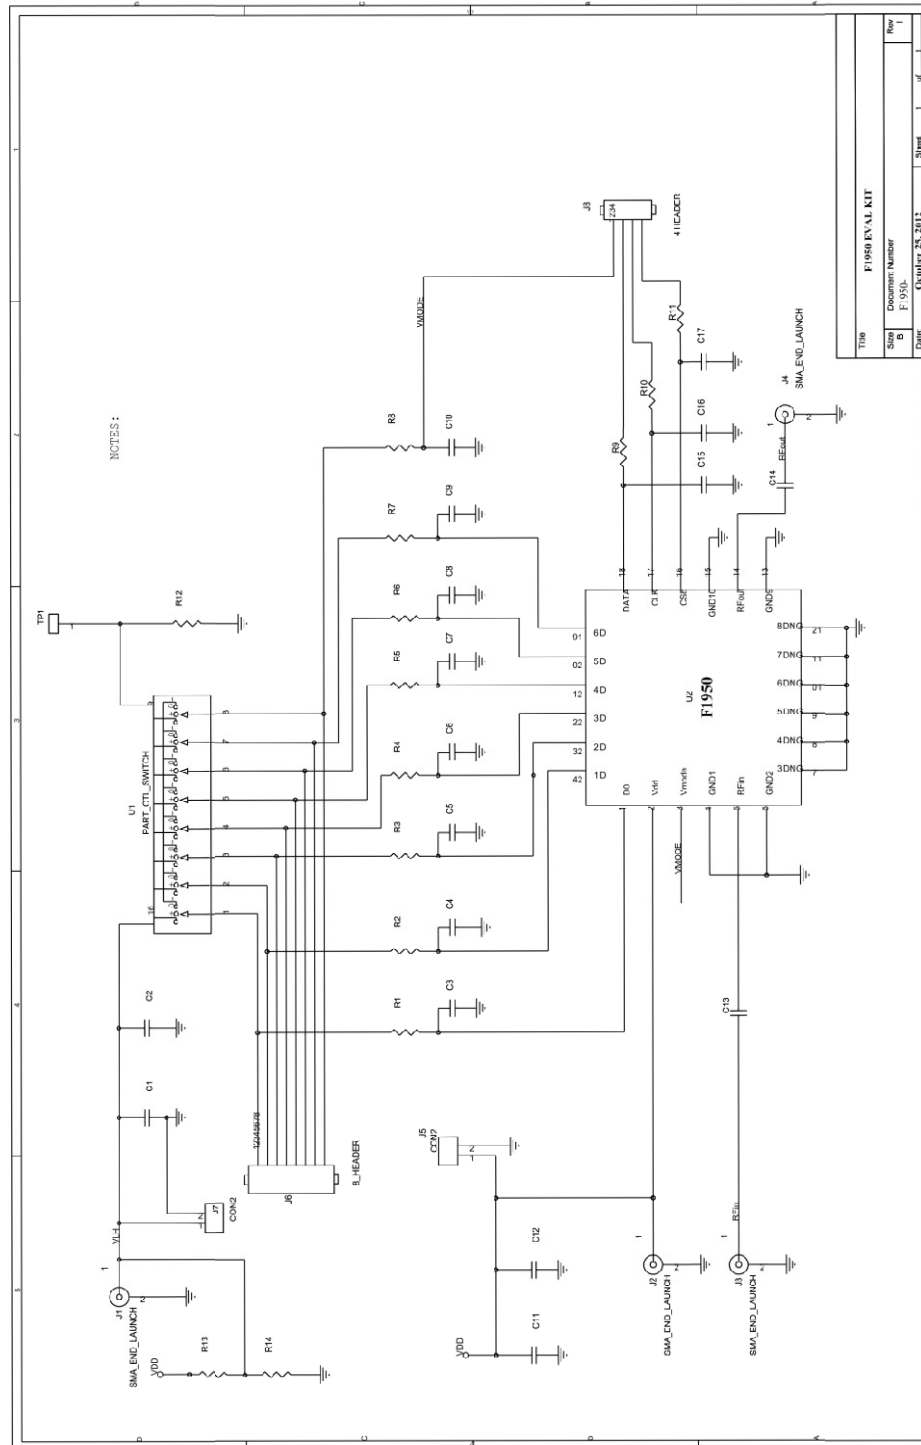

**PIN DESCRIPTIONS**

Pin #	Pin Name	Pin Function
1	DO	Parallel Control – 0.25 dB attenuation step. Pull high for 0.25 dB Attenuation.
2	V <sub>DD</sub>	Main Supply. Use 3.3V or 5V. Current is < 1 mA.
3	V <sub>MODE</sub>	Pull low for parallel mode. Pull high or leave unconnected for serial mode.
4	GND	Connect directly to paddle ground or as close as possible to pin with thru via.
5	RF1	Device RF input or output (bi-directional). Must AC couple to this pin.
6	GND	Connect directly to paddle ground or as close as possible to pin with thru via.
7	GND	Connect directly to paddle ground or as close as possible to pin with thru via.
8	GND	Connect directly to paddle ground or as close as possible to pin with thru via.
9	GND	Connect directly to paddle ground or as close as possible to pin with thru via.
10	GND	Connect directly to paddle ground or as close as possible to pin with thru via.
11	GND	Connect directly to paddle ground or as close as possible to pin with thru via.
12	GND	Connect directly to paddle ground or as close as possible to pin with thru via.
13	GND	Connect directly to paddle ground or as close as possible to pin with thru via.
14	RF2	Device RF input or output (bi-directional). Must AC couple to this pin.
15	GND	Connect directly to paddle ground or as close as possible to pin with thru via.
16	LE	Latch Enable. Serial Data latched into active register on rising edge.
17	CLK	Serial Clock Input
18	DATA	Serial Data Input
19	D6	Parallel Control – 16 dB attenuation step. Pull high for 16 dB Attenuation.
20	D5	Parallel Control – 8 dB attenuation step. Pull high for 8 dB Attenuation.
21	D4	Parallel Control – 4 dB attenuation step. Pull high for 4 dB Attenuation.
22	D3	Parallel Control – 2 dB attenuation step. Pull high for 2 dB Attenuation.
23	D2	Parallel Control – 1 dB attenuation step. Pull high for 1 dB Attenuation.
24	D1	Parallel Control – 0.5 dB attenuation step. Pull high for 0.5 dB Attenuation.
EP	Exposed Paddle	Connect to Ground with multiple vias for good thermal relief.

## **EVKIT THROUGH-REFLECT-LINE (TRL) CALIBRATION**

The “Through-Reflect-Line” (TRL) method [1] is used to de-embed the evaluation board losses from the S-parameter measurements of the F1950. This method requires the use of three standards: a through, a reflection, and a line. The TRL method has the advantage over other calibration methods in that it requires only one of these three standards to be well defined.

The TRL through which is used for the F1950 TRL calibration was constructed identically to the evaluation board, minus the DUT and its corresponding length. Therefore, the through corresponds to a precise zero length connection between the input and output reference planes of the DUT. This through satisfies the requirement of the TRL method that one of the three standards be precisely specified.

The TRL reflection standard used is constructed identically to the input and output lines of the evaluation board, with a short placed at the reference plane of the DUT. In accordance with the TRL method’s requirements, the actual magnitude and phase were not accurately specified, but the phase was known to within 90 degrees and the TRL reflection standard has a magnitude close to one.

The TRL line standard is identical to the TRL through, but with an additional length of 0.8 inches (2 cm). This satisfies the TRL method’s requirement that the TRL be a different length than the TRL through, that it have the same impedance and propagation constant as the through, and that the phase difference between the through and the line be between 20 degrees and 160 degrees. The difference in length yields a phase difference of approximately 20 degrees at 500 MHz, and a phase difference of 160 degrees at 4 GHz.

For characterization of performance from 150 to 500 MHz a separate TRL board with different “Line” length is used.

Standards used for F195x TRL calibration

F1950 evaluation circuit
